Problem statement:

Our challenge is to develop a robust and user-friendly database system that allows travelers to seamlessly book a wide range of travel-related services, including flights, hotels, car rentals, and other travel amenities. This database will revolutionize the way people plan and experience their journeys.

Business Rules

- A traveler can travel to many destinations
- A destination can host many travelers
- Travelers can choose many flights to reach destination
- A flight can carry many travelers
- Travelers can stay in many hotels
- A hotel can have many travelers
- Travelers can choose from different car rental companies
- A car rental can have zero or many travelers
- A service can have many travelers
- Travelers can have many services
- Travelers can search for flights, hotels, car rentals and other amenities like packages based on various criteria, such as destination, dates, and preferences.
- Travelers can select and book flights, hotels, car rental and amenities.
- The system should ensure that bookings do not exceed the available capacity
- Users should receive confirmation emails or notifications after successfully booking an amenity.
- The system should send reminders and updates to users regarding their upcoming trips.
- Travelers must be able to make payments securely through the system, using various payment methods (credit cards, PayPal, etc.).
- Users should be able to cancel bookings within a specified period.
- The system should process refund requests and update the user's account balance accordingly.
- Travelers can rate and review the flights, hotels, and services experienced.
- The system should display these ratings and reviews to help other users make informed decisions.
